Fig. 1: Plot of rect(t-2)

PROBLEM

(GATE EC-1997 Qn 5.2) If the fourier transform of the deterministic signal $x(t)$ is $X(f)$, then

1) The fourier transform of $x(t - 2)$ is
   a) $X(f)e^{-j4\pi f}$
   b) $X(2f)$
   c) $2X(2f)$
   d) $X(f - 2)$

2) The fourier transform of $x(\frac{t}{2})$ is
   a) $X(f)e^{-j4\pi f}$
   b) $X(2f)$
   c) $2X(2f)$
   d) $X(f - 2)$

SOLUTION

1) By the time shifting property of Fourier transform,

$$x(t - t_0) \overset{\mathcal{F}}{\rightleftharpoons} e^{-j2\pi f t_0} X(f) \qquad (0.0.1)$$

$$x(t - 2) \overset{\mathcal{F}}{\rightleftharpoons} e^{-j4\pi f} X(f) \qquad (0.0.2)$$

Let $x(t) = \text{rect}(t)$ and $\text{sinc}(t) = \frac{\sin(t)}{t}$

$$X(f) = \text{sinc}(f) \qquad (0.0.3)$$

For $x(t) = \text{rect}(t - 2)$,

$$e^{-j4\pi f} X(f) = e^{-j4\pi f} \text{sinc}(f) \qquad (0.0.4)$$
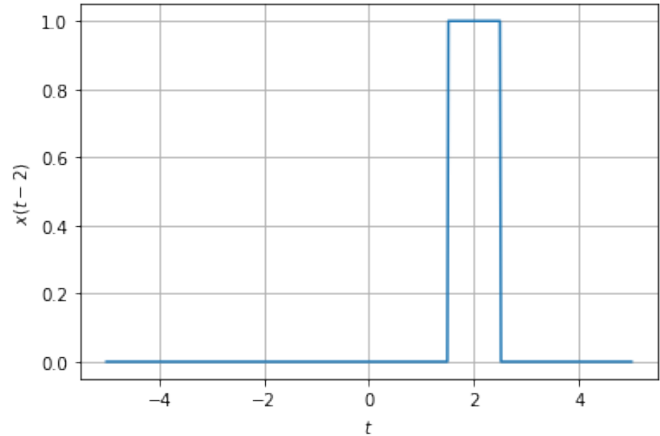

The correct option is (a).

Fig. 2: Fourier transform Simulation v/s Theoretical

2) By the time scaling property of Fourier transform,

$$x(\alpha t) \overset{\mathcal{F}}{\rightleftharpoons} \frac{1}{|\alpha|} X\left(\frac{f}{|\alpha|}\right) \qquad (0.0.5)$$

$$x(\frac{t}{2}) \overset{\mathcal{F}}{\rightleftharpoons} 2X(2f) \qquad (0.0.6)$$

Let $x(t) = \text{rect}(t)$ and $\text{sinc}(t) = \frac{\sin(t)}{t}$
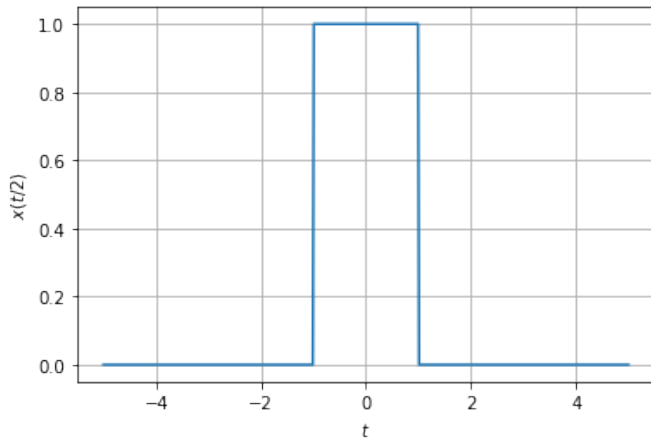

$$X(f) = \text{sinc}(f) \qquad (0.0.7)$$

Fig. 3: Plot of rect($\frac{t}{2}$)

Fig. 4: Fourier transform Simulation v/s Theoretical

For $x(t) = \text{rect}\left(\frac{t}{2}\right)$,

$$2X(2f) = 2\operatorname{sinc}(2f) \qquad (0.0.8)$$

The correct option is (c).
